### CHAT is Now a Consortium!

The Children's Hospital-Acquired Thrombosis (CHAT) Phase I study began in 2014 and created the first large-scale, multi-institutional registry with pertinent medical data from children with confirmed hospital-acquired venous thromboembolism (HA-VTE) and frequency matched controls. Data from this study defined risk factors for HA-VTE in pediatric patients and created risk assessment models (RAMs). The CHAT Consortium was created in **July 2019** and pediatric hospitals across the nation are in the process of executing contracts to join! The CHAT Consortium currently has three open studies, with more to come:

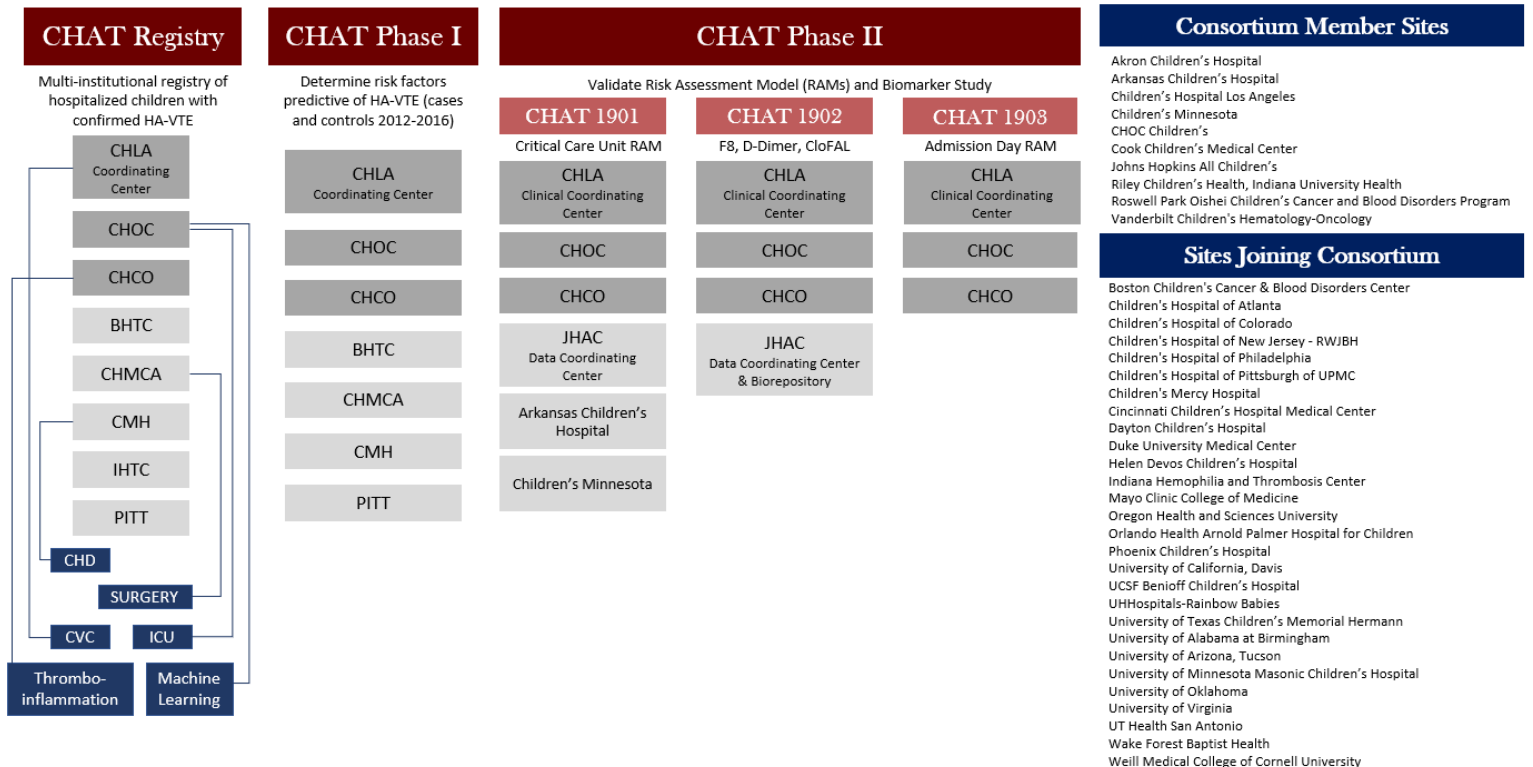

**CHAT Registry:** The CHAT Registry is the largest multi-institutional database of pediatric HA-VTE cases in the nation with over 1200 HA-VTE cases! The Registry continues to add new HA-VTE cases by CHAT Consortium sites for future research.

**CHAT 1901:** Prospective validation of risk assessment model in PICU at 17 sites

**CHAT 1902:** Sister study to CHAT 1901, testing biomarkers to determine their ability to predict HA-VTE at 4 sites
